Objective

Computer Science (AI) undergraduate pursuing B.Tech with hands-on experience in Python and machine learning. Seeking internship or research opportunities to apply AI and software development skills to real-world problems while gaining experience in scalable engineering systems.

Education

B.Tech in Computer Science & Engineering (AI)

Amrita Vishwa Vidyapeetham, Coimbatore

2024 – 2028

CGPA: 8.71

Senior Secondary (XII)

Telangana State Board, Alphores Junior College, Hyderabad

2024

Percentage: 97.9%

Secondary (X)

SSC, Alphores High School, Karimnagar

2022

CGPA: 9.8

Skills

Programming: Python, Basic Java

Machine Learning: Scikit-learn, TensorFlow, PyTorch

Data Analysis: NumPy, Pandas, Matplotlib

Computer Vision: OpenCV

Web Technologies: HTML, CSS, JavaScript

Concepts: Data Structures & Algorithms, Object Oriented Programming, Machine Learning

Projects

An Explainable Hybrid Machine Learning Framework for Fake Job Posting Detection

 Jan 2026 – Mar 2026

- Implemented an explainable machine learning framework to detect fraudulent job postings using hybrid textual (TF-IDF) and credibility-based features.
- Trained and evaluated multiple models including Random Forest, SVM, XGBoost, LightGBM, and a stacking ensemble to improve detection accuracy.
- Applied SHAP (SHapley Additive Explanations) for model interpretability and developed a Streamlit web application for real-time fake job detection with feature-level explanations.

Facial Emotion and Sleep Detection via Audio Feedback: An Assistive AI System

Jan 2025 – Mar 2025

- Developed a real-time assistive AI system for facial emotion recognition and sleep detection using computer vision and deep learning (OpenCV, TensorFlow).
- Created a custom sleep dataset and trained models to identify sleep-related facial patterns from live video input.
- Integrated a text-to-speech audio feedback module (gTTS + pygame) to provide spoken responses based on detected emotional or sleep states.

Secure IoT Data Transmission using Dynamic Shift and Noise Injection

Feb 2026 – Mar 2026

- Designed a lightweight security mechanism for IoT communication using dynamic data obfuscation.
- Applied circular shift operations and controlled noise injection to obscure transmitted data patterns.
- Developed a three-stage protocol using control flags to add and remove obfuscation layers, improving resistance to traffic analysis while maintaining low computational overhead for low-power IoT devices.

Merkle Tree-Based Transaction Storage System Using Cryptographic Hashing

Aug 2025 – Nov 2025

- Implemented a secure transaction storage system using Merkle Trees and cryptographic hashing techniques.
- Developed a backend database and user interface to support transaction creation, storage, and validation.
- Ensured data integrity, consistency, and tamper detection through hash-based verification mechanisms.

Other Projects

- Cancer Type Classification using Gene Expression Data (Machine Learning)
- Airline Seat Reservation System using Heap Data Structure

Certifications & Achievements

- Presented paper at ICRAIC2IT-2025 – 2nd International Conference on Recent Advancements in AI and Computational Intelligence
- Google for Startups – Startup School: Prompt to Prototype
